

CONCEPT PITCH BOARD · REACT, DON'T POLISH

DOC & PIP MATH WORKBOOK

Pip works it out — confidently, charmingly wrong. Doc's key names the mistake and fixes it. The errors aren't random: they're the ones real learners actually make. Warm, retro-schoolbook, print-friendly.

EXPLAIN
THE MATH

Pip's mistakes are the ones your students **actually make**. Doc's key shows **why** — and **how to fix it**. Error on the left, correction on the right: teacher insight built into the page.

PIP'S CLUELESS WORKBOOK

The worksheet page — Pip's confidently-wrong working in the margins. Every wrong answer is a real common mistake. Three layout takes.

PIP'S PRACTICE

Factoring Warm-Up

Name: _____

Date: _____

1. Factor 12 two ways.

$12 = 5 + 7$

$12 = 3 + 9$ ✓?

2. Is 4 a factor of 20?

*No - 4 is too big
(feels wrong tho)*

3. All factors of 18.

1, 2, 8, 9, 18

- 4.
- $24 = \text{---} \times \text{---}$

 *$24 = 6 \times 5$, right
Doc??**"pretty sure factoring means adding. i'll
ask Doc."*

One Problem, One Big Slot

1. Break 15 into a product.

$15 = 3 \times 4$ (close enough??)

2. Factor 16 as a square.

$16 = 8 \times 8$

3. Is 7 a factor of 35?

*no clue. circling YES, fingers
crossed**— Pip, breathing heavily*

Speed Round

1. $6 \times ? = 24$

$= 5$

2. Factors of 9

1, 9

3. $8 = ? \times ?$

$2 + 6$

4. Is 3 a factor of 21?

nope

5. Factor 10

$10 = 5 + 5$

score: uh. don't look, Doc

DOC'S ANSWER KEY

Same problems, over-the-top correct. One Doc line per problem naming Pip's exact error — a miss is a miss, no credit for near.

2A

DOC'S OFFICIAL KEY

The Answers. Obviously.

1. $12 = 2 \times 6$ or 3×4

"You *ADDED*. $5+7$ is a sum, not a factor. Factoring *MULTIPLIES*. Wrong operation — start over."

2. Is 4 a factor of 20? **YES** — 4×5

"Too big' isn't a reason. 4 goes into 20 exactly five times. The answer is yes. Moving on."

3. Factors of 18: **1, 2, 3, 6, 9, 18**

"8 isn't a factor — $18 \div 8$ doesn't divide. You skipped 3 and 6. Factors come in *PAIRS*. Incomplete."

4. $24 = 6 \times 4$

" 6×5 is 30, not 24. Not close — just wrong. The factor you wanted is 4. Next problem."

2B

HOW THEY PAIR

Flip to the back → Doc explains

PIP • pg 3

$$24 = 6 \times 5$$

18: 1, 2, 8, 9

$$12 = 5 + 7$$

the mistake ✎

DOC • KEY 3

$$24 = 6 \times 4$$

18: 1, 2, 3, 6, 9, 18

$$12 = 3 \times 4$$

the fix ✓

Same problem numbers, mirrored layout —
teachers lay the two side by side and read the
error against the fix.

DESIGN NOTE

DOC'S RULE

2C

No credit for close.

Doc never softens. A wrong answer is wrong — full stop. Effort is noted and dismissed. He roasts the **confusion**, never the pupil, then hands over the real answer and moves on.

"E for Effort. Which is an F. Here's how you actually do it —"

— Doc, unmovable
